HAIRLINE CRACKING

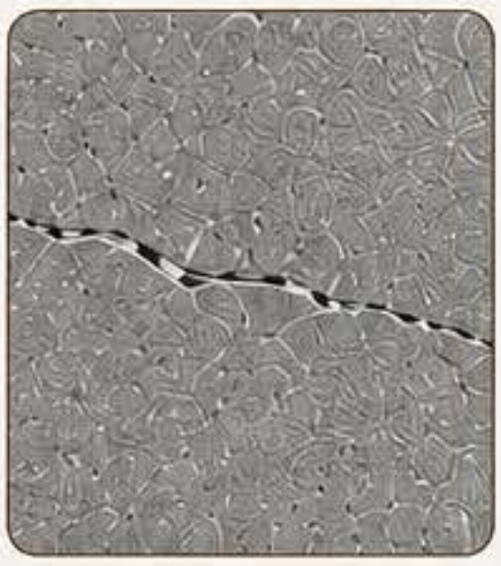

— SOMETIMES CONCRETE CRACKS! —

Even with steel reinforcement, finished precast concrete products can sometimes develop hairline (shallow) cracks. These are usually cosmetic and not a structural concern.

BUILT FOR STRENGTH

All our products are reinforced with steel reinforcement for certifiable structural integrity.

WHAT THE EXPERTS SAY

"One of the first things you learn about the properties of concrete is it has much greater compressive strength than tensile strength. Reinforcing with rebar is a great way to add the missing tensile strength to a concrete structure to prevent any structural cracking from occurring, but sometimes shallow cracks can occur near the surface during production. For most products, these cracks do not threaten the immediate structural integrity of the concrete, but they still create a negative appearance on the concrete surface..."

– National Precast Concrete Association

WE STAND BEHIND OUR PRODUCTS

If you have cracking that you feel is more than a hairline crack, please contact us and we can get more information about your installation.
